OUTCOME
Students will receive quality health care services related to health and wellness.

OUTCOME SUPPORTS
- University: Goal 2
- Division: Goal 2
- Department: 
- Other: 

OUTCOME TYPE
- Performance Outcome
- Student Learning Outcome

ASSESSMENT APPROACH
- Direct assessment
- Indirect assessment

DATA COLLECTION METHODS
- Survey

METHODS AND MEASURES
Student Wellness is dedicated to educating students on health and wellness and living healthy lifestyles. To assure that students receive preventative education and information during their reproductive health visit, Health Services will use a survey to collect information from the students who had an appointment during a 2-week period in Spring semester 2017. The survey will gather information based on whether students received reproductive and preventive health education during their appointment.

CRITERIA OF SUCCESS
- 80% of participants receive education about their health concern/reason for visit.
- 80% of participants receive education on the various options related to their health concern/visit.
- 80% of participants receive education about the risks and benefits of the various health options/preventive care.
- 80% of participants receive information on screening/testing of Sexually Transmitted Infections.

DATA COLLECTION AND ANALYSIS
The Student Wellness Center sent a Reproductive health/prevention survey to 300 students who visited the health center between April 10, 2017 to April 21, 2017 for reproductive health related visits. 29 responses were received.
- The goal of 80% of participants receiving education about their health concern was not met as only 66.67% received education about Sexually Transmitted Infections.
- The goal of 80% of participants receiving education about contraceptive options was met at 90.91%.
- The goal of 80% of participants having discussed the risks and various options of contraceptive methods was met at 81.82%.
- The goal of participants receiving information about screening and STI services was met at 100%.

IMPROVEMENT ACTIONS
In conclusion the Student Health Center provides ongoing education about reproductive health issues as demonstrated in the survey. There were a limited number of responses that could have been due to the timing of the survey. The survey was sent to participants more than 7 days after their visit to the health center and was sent at the end of the semester close to finals. To increase the likelihood of participation in the survey it is recommended that the survey be sent no later than the week after Spring break.

In regards to the goal that was not met, only 66.67 % of the respondents reported receiving education about sexually transmitted infections. This question could have been too broad as respondents noted that frequency and screening of STIs was discussed 100% of the time.

The question regarding STIs could be more specific about signs, symptoms, treatment and prevention. The results of the survey will be presented to the staff providers and Titan Well team reinforcing the importance of ongoing sexual health and preventative education.

Future studies could include health education provided by the Titan Well team of Student Wellness. Demographics may be added to the survey questions the following academic year, and we will also consider running the survey in the Fall for two weeks and in the Spring for two weeks.
