# **Campus Sentiment Analysis Using Twitter Data**

Afshin Karimi  
Sunny Moon  
Rohit Murarka

Office of Assessment and Institutional Effectiveness  
CSU Fullerton

2017 CAIR Conference - Concord, CA

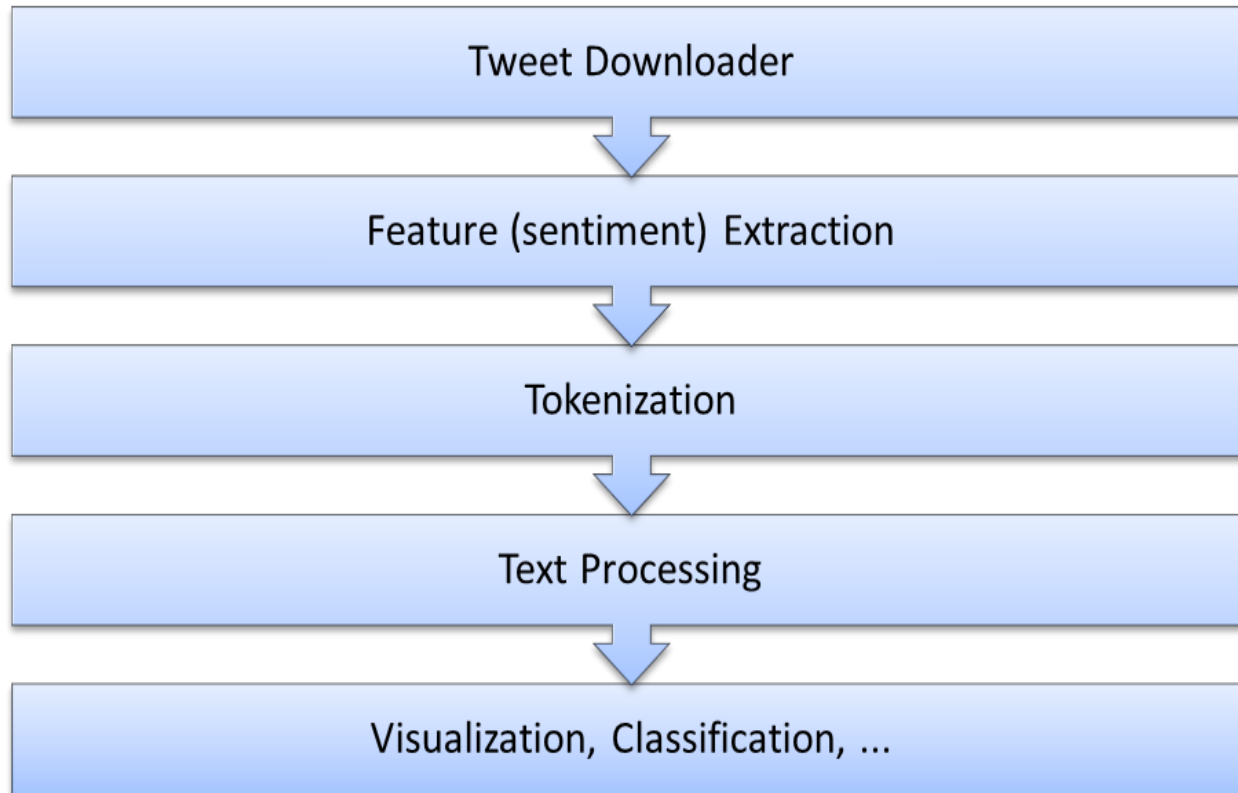

# Sentiment Analysis

- Sentiment analysis (or opinion mining) : uses natural language processing and text analysis to determine author's attitude towards a particular topic in a piece of text
- Basic tasks:
  - Determine polarity (positive/negative/neutral)
  - Determine subjectivity/objectivity
- More advanced tasks include examining emotional states such as anger, sadness, happiness

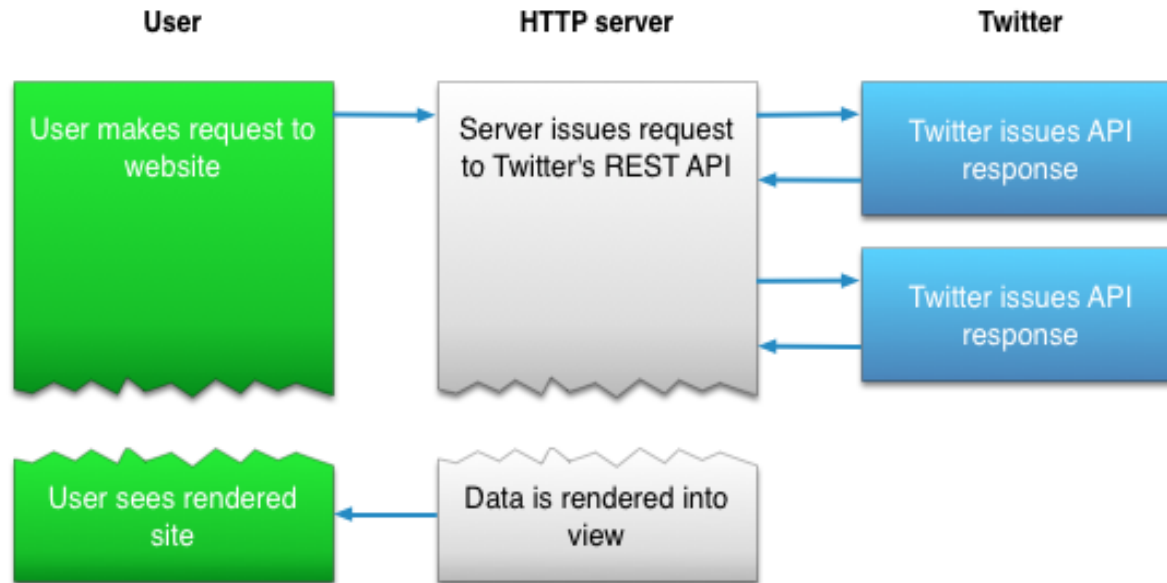

# Opinion Mining in Different Industries

- American Red Cross uses the SaaS tools of Radian6 to monitor social media comments made by its volunteers and donors (in addition to survey and in-person focus groups)
- The Wall Street Journal's Sentiment Tracker tracks Facebook & Twitter users. They share their findings not as scientific public opinion polls, however.
- Dell's 'Social Media Listening Command Center' responds to service related questions and complaints and monitors for consumer trends
- Proctor & Gamble, American Express, DirecTV other corporations with 'listening centers'

# Approach

# Tweet Downloader (through Twitter API)

*source: developer.twitter.com*

# Feature (sentiment) Extraction

- Classical machine learning methods to do polarity classification heavily dependent on training data
- Other methods use external lexical resources like WordNet, or SentiWordNet that identify polarity of words along with intensity
- Building a Twitter classifier model not the goal in this presentation (we use an existing RapidMiner operator for this)

# Challenges of Sentiment Extraction

- What a pronoun, or a noun phrase refers to. "We watched the movie and went to dinner; it was awful." What does "It" refer to?
- Parsing - What is the subject and object of the sentence, which one does the verb and/or adjective actually refer to?
- Sarcasm - If you don't know the author you have no idea whether 'bad' means bad or good.
- Twitter - acronyms, lack of capitals, poor spelling, poor punctuation, poor grammar
- Detecting more in depth sentiment/emotion (beyond positive/negative): how much hate there is inside an opinion....

# Tokenization/Text Processing

- Tokenize: split the document's text into a sequence of tokens (words, sentences, etc.)
- Filter tokens: exclude certain common words, English stop words, etc...
- Choose a schema for processing Tweets (TF/IDF, Term Frequency, Term Occurrence)
- Use the created vectors (list of words) along with Tweet sentiments in Tableau

# RapidMiner Demo.

The screenshot displays the RapidMiner interface with a workflow in the Design view. The workflow consists of the following steps:

- Search Twitter**: Retrieves data from Twitter.
- Generate Copy**: Creates a copy of the data.
- Data to Documents**: Converts the data into document format.
- Analyze Sentiment**: Performs sentiment analysis on the documents.
- Process Documents**: Processes the documents, including word vector creation and meta-information addition.
- Write Excel**: Writes the results to an Excel file.

The interface includes several panels:

- Repository**: Shows data sources like Samples, DB, Local Repository (akarimi), and Cloud Repository (disconnected).
- Operators**: Lists various operators such as Data Access (48), Blending (77), Cleansing (26), Modeling (129), and Scoring (9).
- Parameters**: Configures the **Process Documents** operator with settings like **create word vector** (checked), **add meta information** (checked), and **keep text** (checked).
- Help**: Provides documentation for the **Process Documents** operator, including a synopsis: "Generates word vectors from a text object."

At the bottom, a **Recommended Operators** section suggests:

- Select Attributes (41%)
- Retrieve (38%)
- Filter Examples (35%)
- Generate Attributes (31%)

# Output of 'Search Twitter' operator

ExampleSet (100 examples, 1 special attribute, 11 regular attributes)

# Final thoughts

- Enormous amount of unstructured data available
- Automatic Sentiment Analysis challenging by nature; no perfect tool (yet!)
- No expertise required for basic Sentiment Analysis
